                                                                                                                                                                                                                                                                                                                                                  This cDNA clone corresponds to a strawberry auxin-related gene that is implicated in fruit ripening-related processes. A claimed vector for use in the genetic transformation of strawberry cells comprises a promoter, a regulation sequence and a transcription termination sequence. The regulation sequence comprises the coding region (or a frament of at least 10 bases) selected from 38 claimed strawberry fruit ripening-related genes (see AAT91126.63) that is aligned in the vector in sense or antisense direction. Phenotypically modified strawberry plants can be generated that have one or more of the following fruit characteristics: improved resistance to damage; longer shelf-life; improved processing characteristics; improved flavour and aroma; and modified colour.

the invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (81), given in the specification. The proteins have antibacterial and antihilammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chaminosasays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100 TTGGTGAAGGTTGAGGCTGTTGCTGGTAACCCAACTGATTGGAAGCATATTGCTTATAAG 159

                                                                                                                                                                                                                                                                                                                                                                           This cDNA clone encodes a strawberry auxin-related protein that is implicated in fruit ripening-related processes. It was isolated from a cDNA library of strawberry ripening genes by differential screening using cDNA from fruit receptacle tissue at the ripe and white stages of ripeness, and was identified by homology to sequences in the EMBL database. A claimed vector for use in the genetic transformation of strawberry cells comprises a promoter, a regulation sequence and a transcription termination sequence. The regulation sequence comprises the coding region (or a fragment of at least 10 bases) selected from 38 claimed strawberry fruit ripening related genes (see T91126-63) that is aligned in the vector in sense or antisense direction. Phenotypically modified to strawberry plants can be generated that have one or more of the following fruit characteristics: improved resistance to damage; longer shelf-life; improved processing characteristics; improved colur.

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes). Comprising one of 5481 sequences (61), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN6604-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a componing (I) is used to detect streptococcus in a cused as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chammatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    414490 GGCAAAATGGTTATAACTGATACACCAAAACCAGTCATTGAACAAGAGACAGATGCTGTT 414431

The invention relates to a composition comprising a human GDP-mannose 4.6-dehydratase (GM4,6D) peptide. The peptide is useful for identifying GM4,6D inhibitors are useful for reducing inflammation in a mammalian subject and for treating or ameliorating diseases affected by the level of cellular fucosylation or diseases affected by the by the level of glycoconjugates. These diseases include arthritis, transplant rejection, asthma, sepsis, reperfusion injury, stroke or infection. The GM4,6D peptide or a polynucleotide encoding it is also useful for manufacturing complex carbohydrates and as targets for screening small molecule antagonists of the activity of the enzyme. The polynucleotide is useful in developing an assay for defects in the enzyme, as well as in gene replacement therapy. Sequences

C ABXI7942-ABXI7944 and ABXI7947-ABX33116 represent DNA molecules encoding human GM4,6D peptides of the invention.

Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                             Human; GDP-mannose 4,6-dehydratase; GM4,6D; gene; ss; inflammation; cellular fucosylation; glycoconjugate fucosylation; transplant rejection; arthritis; sethem; sepsifusion injury; stroke; inffection; complex carbohydrate; gene replacement therapy; immunosuppressive; antiinflammatory; antiarthritic; antibacterial; cerebroprotective;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           891 TGGTCAAGAAATTCTATTGGGTGCAACAAGATTTCCTGCTAGTCCAGAATATCATGAAGC 950
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence (ABA9021) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The production helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 2365589 BP; 765914 A; 415261 C; 420487 G; 763927 T; 0 other;

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by an ancelack acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer.
                                                                                                                                             Cancer associated antigen; diagnosis; research; treatment; human; breast cancer; colon cancer; gastric cancer; renal cancer; lung cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          tch

                                                                            534
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method of screening for genes which modulate polyglutamine toxicity using animal models with polyglutamine sequences that cause toxicity in the animal. The model is preferably Drosophila, and toxic polyglutamine sequences include the human and Drosophila heat shock protein 40/HDJ1, tetratricopeptide repeat protein (TPR2) and myeloid leuksemia factor 1 (MLF) genes. The model is useful for identifying treatments for neurodegenerative and proliferative disorders, including Alzheimer's disease, Parkinson's disease, Creutzfeldt-Jacob's disease (CJD), bovine spongiform encephalopathy (BSE), Huntington's disease, Machado-Joseph disease, spinocerebellar atxias, dentatorubropallidoluysian atrophy, Kennedy's disease, stroke, head trauma and cancer.

uncharacterised bacteriophage infects a pathogenic bacterium. The compound active on a target of a bacteriophage inhibitor protein in a bacteria is used to treat or prevent a bacterial infection in an animal.

AAA66243 to AAA69442 and AAB16523 to AAB16554 represent bacteriophage nucleotide and protein sequences which are used in the exemplification of

beterologous promoter sequence. The invention also concerns methods for providing gene therapy for genetic deficiency disorders. Vectors of the invention are useful for delivering a polynucleotide encoding a protecting of polynucleotide encoding a protecting of polynucleotide encoding a protecting the vector is introduced into the vertebrate cell by infection in a viral particle, or by transfection, transduction, or injection either in viro or in vivo. The vector is useful for the delivery and expression of biologically useful proteins in gene therapy protocols, and for biologically useful proteins in gene therapy protocols, and for call virologically useful proteins in gene therapy protocols, and for call virologically useful proteins in gene therapy protocols, and for call virologically useful proteins in gene therapy protocols, and for their use as insertion sites for foreign genes of interest, hybridisation to probes, for chromosome and gene mapping, in PCR technologies, and in the production of sense or antisense nucleic acids. Vectors of the invention provide for stable integration and expression of heterologous DNA in host calls, and are adapted for accepting large heterologous polynucleotide inserts which can be delivered in an infected or transformed cell and expressed in a stable fraction. The current sequence represents a capture of the genome of the genus B entomopoxvirus from amsacta moorei

Sequence 403, Application US/09107532A
Patent No. 6583275
GENERAL INFORMATION:
APPLICANT: Lynn A Doucette-Stamm and David Bush
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
FITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
ENTEROCOCCUS PAECIUM FOR DIAGNOSTICS AND THERAPEUTICS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  341 TITACAAGAGTAACTTAACTCACTCAACTGCTGATGAAATTTCTGAAGGCCCTGTGAAGA 400

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 3221, Application US/09328352
Patent No. 6562958
GENERAL INFORMATION:
FALL INFORMATION:
FALLE OF INVENTION: BACOM et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BACMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 3221
LENGTH: 4860

Patent No. 6531583
GENERAL INFORMATION:
APPLICANT: Classell, Gail H.
APPLICANT: Class, Johnifer S.
APPLICANT: Glass, John I.
APPLICANT: Glass, John I.
APPLICANT: Heiner, Cheryl R.
APPLICANT: Lefkowitz, Elliot
TITLE OF INVENTION: UNCLETC ACID PROBES AND METHOD FOR DETECTING UREAPLASMA; TITLE OF INVENTION: UNCLETC ACID PROBES
CURRENT APPLICANTON NUMBER: US/09/601,198
CURRENT FILING DATE: 2000-12-08
PRIOR FILING DATE: 1998-01-30

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 3814, Application US/09880107

Sequence 3814, Application US/09880107

Patent No. US20020142981A1

GENERAL INFORMATION:

APPLICANT: Horne, Darci T.

APPLICANT: Scherf, Uwe

APPLICANT: Gene Logic, Inc.

TITLE OF INVENTION: Gene Expression Profiles in Liver Cancer;

FILE REFERENCE: 44921-5028-WO

CURRENT APPLICATION NUMBER: US/09/880,107

CURRENT FILING DATE: 2001-06-14

PRIOR FILING DATE: 2000-06-14

PRIOR PLING DATE: 2000-06-14

PRIOR APPLICATION NUMBER: US 60/231,054

PRIOR PLING DATE: 2000-10-02

NUMBER OF SEQ ID NOS: 3950

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 3814

LENGTH: 198285
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          71 CAGTICCAGAATTAAAGGAGGGTACAGCCTTGGTGAAGGTTGAGGCTGT 119
